

It is a good subject to test project managing skills in a realistic environment and refine students' teamwork capabilities.

However, this subject has a few problems that require urgent addressing.

Currently, the workload is excessive for students who have many other subjects to deal with. This subject should have less projects through the year.

The control check is easy to fail even if you know the subject well and doesn't appropriately assess the knowledge of students. A project-defense model would be more fit for this class and would make it both easier for professors to evaluate and for students to work with.

The systems we use in the class are very outdated, which is a problem in a field that is constantly changing. Experience with up-to-date systems would be more marketable and useful in the field both for the local scene and the wider picture, plus it's harder to work with outdated, sometimes poorly documented systems with a dwindling community of users.

A suggestion is that this class could teach front end frameworks as well, JS and CSS.
